DigitalStakeout Platform

Risk Monitoring and Investigative Intelligence Platform

Scout detects events, risks and threats across social media, the web and dark web sources. Your team investigates them in Nexus, and each result stays in a knowledge graph you reuse.

20
risk categories in the Scout taxonomy

1,400+
risk scenarios each item is classified against

40+
languages classified, with the original kept

Monitor, Investigate, or Have Our Analysts Do Both

Scout monitors public sources and raises alerts. Your team runs the investigation and the cited report in Nexus. Our analysts can run either product for you.

Scout
Risk monitoring software

Watches public sources for events and risks to your people and brands, and alerts your analysts.

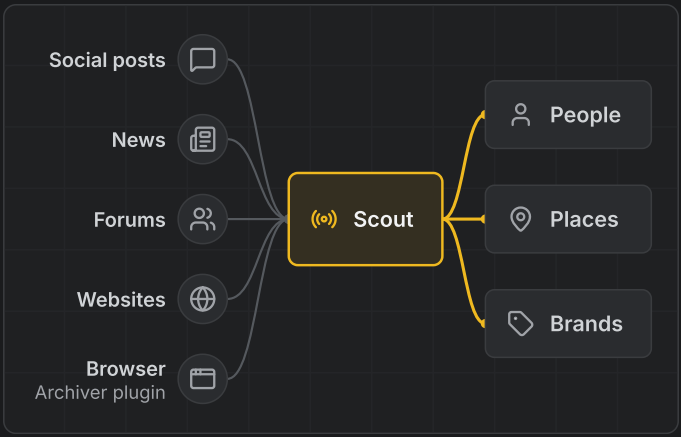

Nexus
Investigative intelligence platform

Builds an entity resolved knowledge graph from leads, documents and Scout events, with every source attached.

Intelligence Services
Managed intelligence services

Our analysts run the monitoring, investigations and reporting you hand them.

Scout Takes In Your Sources and Classifies What Arrives

Bring In Public and Internal Sources

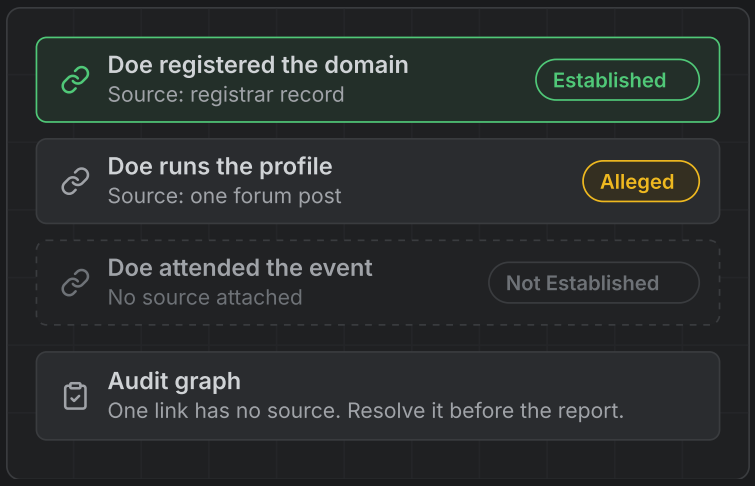

- Start from an alert, a domain or a document.
- Bring in public content from the web, social media and dark web sources.
- Add your own feeds, watchlists and incident notes, by email, webhook or API.
- Run screenshots and video transcripts through the same workflow as text.

Classify What Scout Collects

- Identify the specific event or threat each item describes.
- Extract the people, places and assets in each item, with its source context.
- Group reposts into one incident instead of counting every copy.
- Route each risk to the team that owns it, by severity.

From One Lead to a Sourced Finding

Nexus turns Scout events, leads and documents into an entity resolved knowledge graph. ChatGraph™, the AI graph builder in Nexus, researches each subject your team points it at and puts a source on every link.

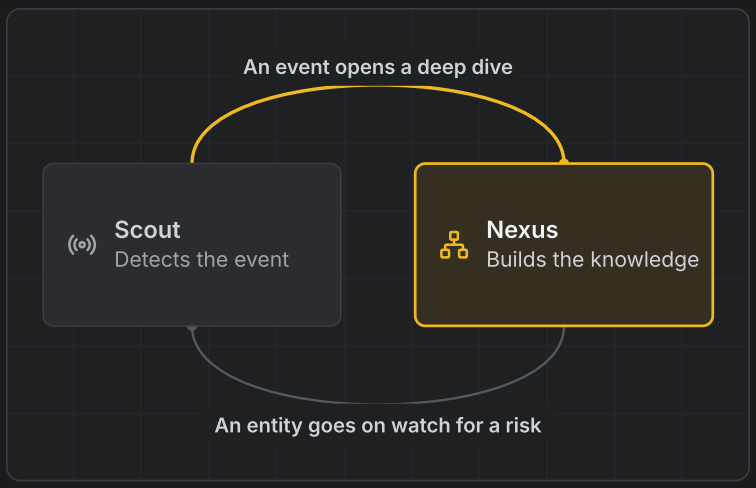

Check Every Link Before It Reaches a Report

- ChatGraph writes each sourced link into the case as research runs.
- Records for the same subject merge. Uncertain matches wait for an analyst.
- Due diligence research on a company or person ends in a cited report.
- Audit Graph proposes corrections, and your reviewer accepts or rejects each one.

Keep Watching After the Case Closes

- Put an entity from the case on a Scout monitor for a specific risk, such as a threat.
- A new Scout event on that entity reopens the case, with its source and date.
- Every entity, link and source stays in your knowledge graph.

Connect It to the Systems You Already Run

Inputs

Email, webhook and API, plus page capture from the browser.

Alerts and data

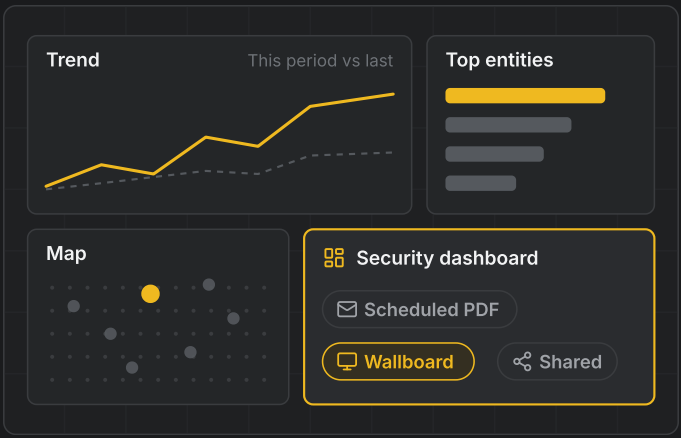

REST API and webhooks into SIEM, SOAR and case management.

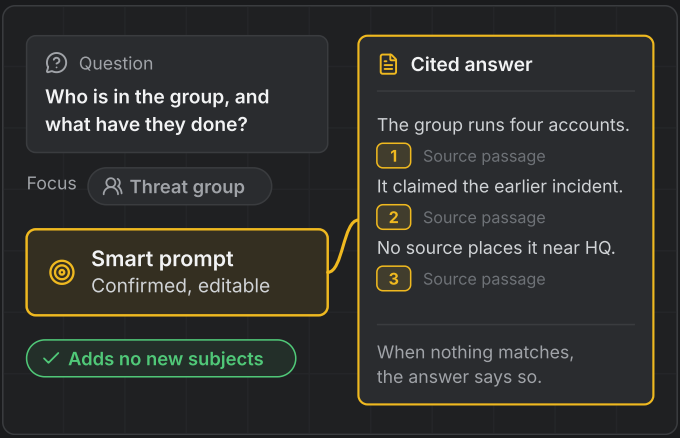

Reports and exports

Reports to PDF, Word or HTML. Graphs to GraphML, JSON or CSV.

Analyze, Report and Share What You Find

Scout turns monitored events into dashboards and scheduled reports. In Nexus, your team asks questions of a case and gets answers with a citation on every claim.

Scout Dashboards, Reports and Analytics

- Build saved dashboards from trend, top entity and map widgets.
- Build sectioned reports from tagged records, with AI drafts the analyst reviews.
- Compare any period with the one before it in the Analytics Builder.

Nexus Cited Answers and Reports

- Ask a question and get an answer built only from the case evidence.
- Choose report sections from a catalog, each with its citations.
- When the evidence does not answer, the report says so.

Export and Delivery Formats

Console exports

CSV, XML or JSON, plus web capture, evidence and removal request PDFs.

Scheduled delivery

Dashboards and reports emailed as PDFs, or shown on a wallboard.

Report formats

Scout reports to PDF, PowerPoint or Word. Nexus reports to PDF, Word or HTML.
